May 31st, 2020 - Wound Care At The End Of Life Care Is A Plex And Challenging
There is only one opportunity to get it right. There is no practice or rehearsal in the words of the pioneer who recognised the importance of holistic care.

Case studies in palliative wound care: There may be instances when advanced therapies are contraindicated in elderly patients. In other instances, elderly patients with multiple oribidity may be wary of the risks of surgical intervention for lower extremity wounds. Accordingly, these authors offer a variety of case studies that illustrate fundamental principles of palliative wound care.

Palliative wound care at the end of life: Wound care is a form of palliative care that supports the health care needs of dying patients. It focuses on alleviating symptoms and healing wounds. However, if done without proper consideration of the patient's wishes and best interests, it can impair the quality of the end of life for the dying.

Understanding wound care in the hospice and palliative setting: Palliative wound care goals are critical and need as few options as possible for individuals at the end of life with wounds. Palliative wound care practices for wounds at end of life are under development. Palliative wound care for malignant fungating wounds: Timely holistic interventions are aimed at easing the despair of patients with advanced cancer and malignant fungating wounds. People with MFWs must incorporate patient and family goals of care in all aspects of decision making.

Palliative wound care at the end of life: Wound care at end of life is intended to be a quick reference guide for palliative management of wounds in hospice care. The authors and collaborators have systematically reviewed and collected the pertinent literature and resources related to palliative wound care.

Palliative wound care practices for wounds at end of life: Wound care professionals can manage wounds at end of life by utilizing evidence-based standards from guidelines for end of life care in nursing facilities.

Palliative wound care healing and managing wounds: End of life wounds include pressure injury ischemic wounds and Kennedy ulcers. In 2009, skin changes at the end of life were a concept introduced to describe end of life wounds. These ulcers are considered unavoidable especially in immobile patients at the end of life.

Palliative wound care at the end of life: Wound care at end of life is intended to be a quick reference guide for palliative management of wounds in hospice care. The authors and collaborators have systematically reviewed and collected the pertinent literature and resources related to palliative wound care.
